RE: Roof Saver Class A Fire Rating for ridge vents

Roof Saver ridge vent holds a Class A Fire Rating based on the results of testing performed by an accredited, independent third party testing company.

The Class A Fire Rating is the highest fire-resistance rating for roofing per ASTM E -108. Materials carrying this rating indicate that they are able to withstand severe exposure to fire originating from sources outside the building.

Class A roof coverings effectively resist burning when exposed to severe fire test exposures, afford a high degree of fire protection to the roof deck, do not slip from the installed position and are not expected to give off flying brands.
